| **Team ID** | _____ |
| **Project Name** | Import Data using Transform Maps (Spreadsheet) |
| **Maximum Marks** | 2 Marks |

## Proposed Solution Template:

The project team has filled the following information in the proposed solution template.

| S.No. | Parameter | Description |
|---|---|---|
| 1. | Problem Statement (Problem to be solved) | Administrators and analysts receive data in Excel spreadsheets. Entering it manually into ServiceNow is slow and error-prone, and repeated imports create duplicate records. |
| 2. | Idea / Solution description | Create a spreadsheet and a custom target table. Load the spreadsheet into an Import Set table, build a Transform Map with field maps, transform and validate the data, and enable coalesce on a unique field so existing records are updated and only new records are inserted. Present the data through a report added to a dashboard. |
| 3. | Novelty / Uniqueness | Uses only standard, no-code ServiceNow import features (Import Sets, Transform Maps, Coalesce). The same transform map is reusable for every future spreadsheet that follows the same format. |
| 4. | Social Impact / Customer Satisfaction | Saves hours of manual work, reduces human error, and gives users clean and trusted data, which increases satisfaction and confidence in reports. |
| 5. | Business Model (Revenue Model) | Internal productivity solution within the ServiceNow platform. Value is delivered through reduced effort and cost; it can be offered as a reusable data-import service or template to other teams or clients. |
| 6. | Scalability of the Solution | Transform maps run on the ServiceNow platform and can handle large row counts. Additional spreadsheets, tables and transform maps can be added without changing the design. |
